## Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

## **Listing of Claims:**

 (Currently amended) A method of searching unstructured data stored in a database, the method comprising:

storing unstructured data in a column of a database table;

allowing a user to identify elements in the unstructured data as indexed elements; in response to the user-identified elements, creating an intermediate index into the unstructured data from the user-identified elements, the intermediate index comprising one or more database tables mapping the user-identified elements in the unstructured data as the indexed elements; and

allowing a user to create queries on the unstructured data using the indexed elements.

- (Original) The method of claim 1 wherein the queries specify at least one value and an operation that is to be performed on an identified element.
- (Original) The method of claim 2 wherein the queries further include a start date and an end date.
- (Original) The method of claim 1 wherein the unstructured data is stored in character large object (CLOB) format.
- (Original) The method of claim 4 wherein the unstructured data comprises a well-formed XML document stored within a column of a database table.

Appl. No. 10/731,604 Amdt. dated May 22, 2007 Amendment under 37 CFR 1.116 Expedited Procedure Examining Group 2168

- (Original) The method of claim 5 wherein XML fields of the unstructured data are filled with transaction data from a database transaction based on a predefined mapping to multiple data sources.
- (Original) The method of claim 6 wherein the multiple data sources are comprise multiple tables of a database.
- (Original) The method of claim 1 wherein the unstructured data is part of an electronic record stored in a common repository of electronic records that provides an audit trail that cannot be altered or disabled by users of the system.
- 9. (Currently amended) A method of searching XML data stored in a column of a database table in character large object (CLOB) format, the method comprising: storing the XML data in the column of the database table, wherein the XML data comprises a first plurality of XML elements that conform to a first data type definition (DTD) and a second plurality of XML elements that conform to a second DTD;

allowing a user to identify elements from the first and second plurality of XML elements in XML data as indexed elements:

in response to the user-identified elements, creating an intermediate index into the XML data from the user-identified elements, the intermediate index comprising one or more database tables configured to map the user-identified elements in the unstructured data as the indexed elements; and

allowing a user to create queries on the unstructured data using the indexed elements.

10. (Original) The method of claim 9 wherein the first and second DTDs include first and second XML elements, respectively, that share a common name but represent different types of data and wherein the user can create a first indexed element that represents the first XML element and not the second XML element and a second indexed element that represents the second XML element and not the first XML element.

PATENT

Appl. No. 10/731,604

Amdt. dated May 22, 2007 Amendment under 37 CFR 1.116 Expedited Procedure

Examining Group 2168

 (Currently amended) A computer system for searching unstructured data stored in a database, the computer system comprising:

a processor;

a database; and

a computer-readable memory coupled to the processor, the computer-readable memory configured to store a computer program;

wherein the processor is operative with the computer program to:

- (i) store unstructured data in a column of a database table;
- (ii) allow a user to identify elements in the unstructured data as indexed elements:
- (iii) in response to the user-identified elements, create an intermediate index into the unstructured data from the user-identified elements, the intermediate index comprising one or more database tables configured to map the user-identified elements in the unstructured data as the indexed elements; and
- (iv) allow a user to create queries on the unstructured data using the indexed elements
- (Original) The computer system of claim 11 wherein the queries specify at least one value and an operation that is to be performed on an identified element.
- (Original) The computer system of claim 11 wherein the unstructured data is stored in character large object (CLOB) format.
- 14. (Previously Presented) The computer system of claim 11 wherein the unstructured data comprises well-formed XML documents stored within a column of a table stored in the database.
- 15. (Original) The computer system of claim 14 wherein fields of the unstructured data are filled with transaction data from a database transaction based on a predefined mapping to multiple data sources.

PATENT

Appl. No. 10/731,604

Amdt. dated May 22, 2007

Amendment under 37 CFR 1.116 Expedited Procedure

Examining Group 2168

 (Currently amended) A computer program stored on a computer-readable storage medium for searching unstructured data stored in a database, the computer program

comprising:

storing unstructured data in a column of a database table;

allowing a user to identify elements in the unstructured data as indexed elements;

in response to the user-identified elements, creating an intermediate index into the

unstructured data from the user-identified elements, the intermediate index comprising one or more database tables configured to map the user-identified elements in the unstructured data as

the indexed elements; and

allowing a user to create queries on the unstructured data using the indexed

elements.

17. (Original) The computer program of claim 16 wherein the queries specify

at least one value and an operation that is to be performed on an identified element.

18. (Original) The computer program of claim 16 wherein the unstructured

data is stored in character large object (CLOB) format.

 (Original) The computer program of claim 16 wherein the unstructured data comprises well-formed XML documents stored within a column of a table stored in the

database.

20. (Previously Presented) The computer program of claim 16 wherein fields

of the unstructured data are filled with transaction data from a database transaction based on a

predefined mapping to multiple data sources.
